

What is the effect of a four-day work week on productivity?

This report summarises the verified evidence gathered.

What the evidence shows

The source states that across the trial period, hourly productivity increased by 8%, while total weekly output remained. ^[1]

The source states that participating organisations numbered 61 in total, spread across four countries and covering sectors from. ^[1]

The source states that respondents reported markedly higher satisfaction scores under the shorter working schedule than under their. ^[2]

Caveats and limitations

The source states that the survey covered the same programme as the trial and relies entirely on self-reported measures rather than. ^[2]

The source states that the absence of a control group means the observed changes cannot be attributed to the schedule change with. ^[3]

The source states that several participating organisations had already begun other efficiency programmes before the trial began. ^[3]

Conclusion

The evidence rests on 6 verified finding(s) ^[1].
